

Fundamental Datatypes:

int , float, Boolean

Advance Datatypes:-

#. List :

#. Tuple

#. Set :

#. Dictionary

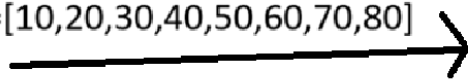

List:-

#. List is an ordered sequence of items.

#. Each element or value that is inside of a list is called an item.

#. All the items in a list do not need to be of same type(heterogenous)

```
num=[10,20,30,40,50,60,70,80]
```

0: 5:2

Slicing:-

□ Syntax:- [start:stop:step]

o/p:

10

20

30

40

```
print(num[0:4])
```

Mutable:-

List:

Mutable: value of elements of a list can be altered in the same object.

list.append()

#. used to add only 1 item at the end of list

#. item can be either int,float,str,bool,list

list.extend()

used to add multiple item in a list

it adds each item individually at the end

`list.append()`

#. used to add only 1 item at the end of list

#. item can be either int,float,str,bool,list

`list.extend()`

used to add multiple item in a list

it adds each item individually at the end

Tuple:-

#. Tuple is similar to list except tuple are immutable which means we cannot change the elements of a tuple once assigned.

#. When we do not want to change the data over time ,tuple is preferred datatype.

#. Iterating over the elements of a tuple is faster compared to iterating over a list.
