

Implicit Wait:

- #. Applies globally to all elements.
- #. Set Once for the entire driver session
- #. Not condition-based.
- #. Simple and quick to set

Explicit Wait

- #. Waits for a specific condition
- #. Uses WebDriverWait + Expected_Condition
- #. Scope : Specific Element
- #. Condition : Yes

POM Framework (Page Object Model)

- #. The Page Object Model (POM) Framework is a design pattern used to make test automation code more organized, reusable, and maintainable.

POM Separates

- #. Page Structure (Locator + Action)
- #. Test Logic

#. Each Web page is represented as a class and elements/actions on that page are defined as methods.

Why Use POM?

Without POM:

#. Code becomes messy and repetitive.

#. Hard to maintain when UI (User Interface) Changes

with POM

#. Clean Structure

#. Reusable Code

#. Easy Updates (Change locator once, reflect everywhere)
