

## **OOP(Object Oriented Programming)**

**#. To map the real world scenarios, we started using objects in code.**

**#. this called Object Oriented Programming.**

### **Class:**

**#. Class is a blueprint for creating objects.**

### **Constructor**

**#. All classes have a function called `__init__()` which is always executed when the object is being initiated.**

**#. The self-parameter is a reference to the current instance of a class, and is used to access variable that belongs to that class.**

### **Methods:-**

**#. Methods are the functions that belongs to objects.**

**Create Student class that takes name and marks of 3 subject as an argument in constructor.**

**Then create a method to print the average.**

### **Abstraction:**

**#. Hiding the implementation details of a class and only showing the essential features to the user.**

## Encapsulation:

#. Wrapping data and function into a single unit.

Create Account class with 2 attribute- balance & account no

Create method for debit, credit and printing the balance.

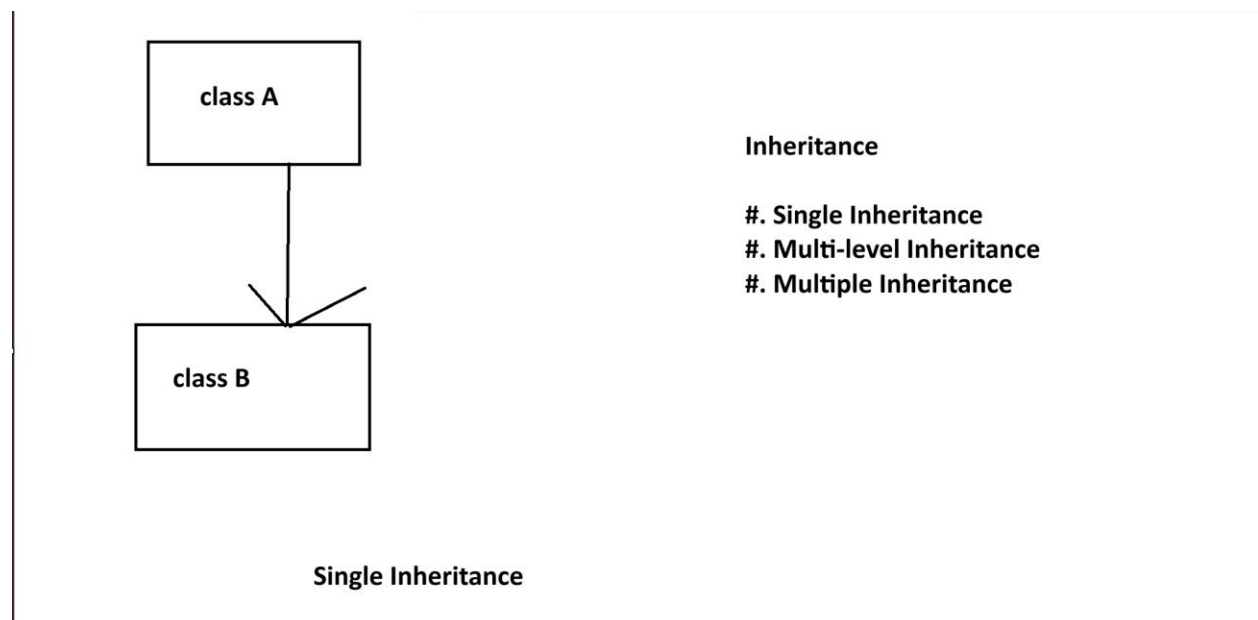

Private(like) attribute and methods

#. Private attribute and methods are meant to be used only within the class and are not

accessible from outside the class.

## Inheritance:

#. When one class (Child/Derived/Sub) derives the properties and method of another class ( Parent/Base/Super)

## **Selenium:**

**#. For Automation**

**#. To Save the time and reduces the human effort.**

**#. Platform Independent**

**#. It is an automation tool which control the web browser**

**#. It will be have the pre defined libraries ,so we can use in our automation script**

**#. Support Multiple browsers**

**#. Support Multiple Programming Language**

**#. Opensource and Free**

**#. It can be easily integrated with tools like TestNG, CICD, Jenkins etc....**

**#.**
